Collaboration with ECUA brings exciting changes to the construction schedule.

Since the flood event, the remaining portions of asphalt and curb have further deteriorated. This has prompted the County to revise the contract and plans to include complete roadway reconstruction between Fairview Drive and Clearwater Avenue. *(See illustration 1.)* Full roadway replacement will also be performed in conjunction with ECUA, which desired to make further improvements to their infrastructure including additional sewer main replacement and water line upgrades.
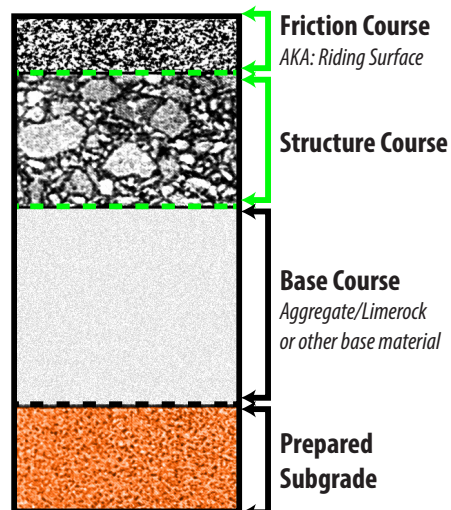

While the construction plans were being revised and contracts amended, the County stopped its contractor's work temporarily, which allowed ECUA to complete its improvements. The County's contractor will resume construction with amended plans on November 17.

Once the contractor returns, he will be able to move forward full speed toward a quality final product. The County anticipates the project will be completed by February 6, 2015.*

Friction Course
AKA: Riding Surface

Structure Course

Base Course
Aggregate/Limerock or other base material

Prepared Subgrade

The structure course consists of aggregate mixed with bitumen, a tar-like substance better known as asphalt. When mixed, heated, and compressed, the two materials form a durable bond suitable for roadways.

Friction course, also known as riding surface, includes a skid-resistant aggregate and has a texture designed to allow water to drain from the roadway. This reduces water spray and helps prevent water from pooling on the roadway.

NOTE: Construction activities are weather-dependent and may be delayed or rescheduled in the event of inclement weather.
